

Lab 11 – Implement Conditional Logic

Lab Overview

In real-world conversations, users do not always follow the same path. A copilot must be able to make decisions and provide different responses based on user inputs. This is where Conditional Logic becomes important.

In this lab, you will implement conditions in a conversation flow and create multiple conversation paths based on employee selections. You will learn how Copilot Studio can make decisions using variables and conditions, creating more intelligent and personalised experiences.

Learning Objectives

By the end of this lab, you will be able to:

- Create and configure Condition nodes.
- Build decision-based conversation flows.
- Route users to different responses based on their choices.
- Use variables within conditions.
- Design dynamic conversations that adapt to user inputs.

Business Scenario

The HR department has asked you to create a Leave Assistant. Employees contact HR with different leave-related requests. Some employees want to apply for leave. Some want to check their leave balance. Others want to understand leave policies. Instead of creating separate topics, you will build a single conversation that intelligently routes employees to the correct information based on their selection.

Expected Conversation

Employee: "I need help with leave."

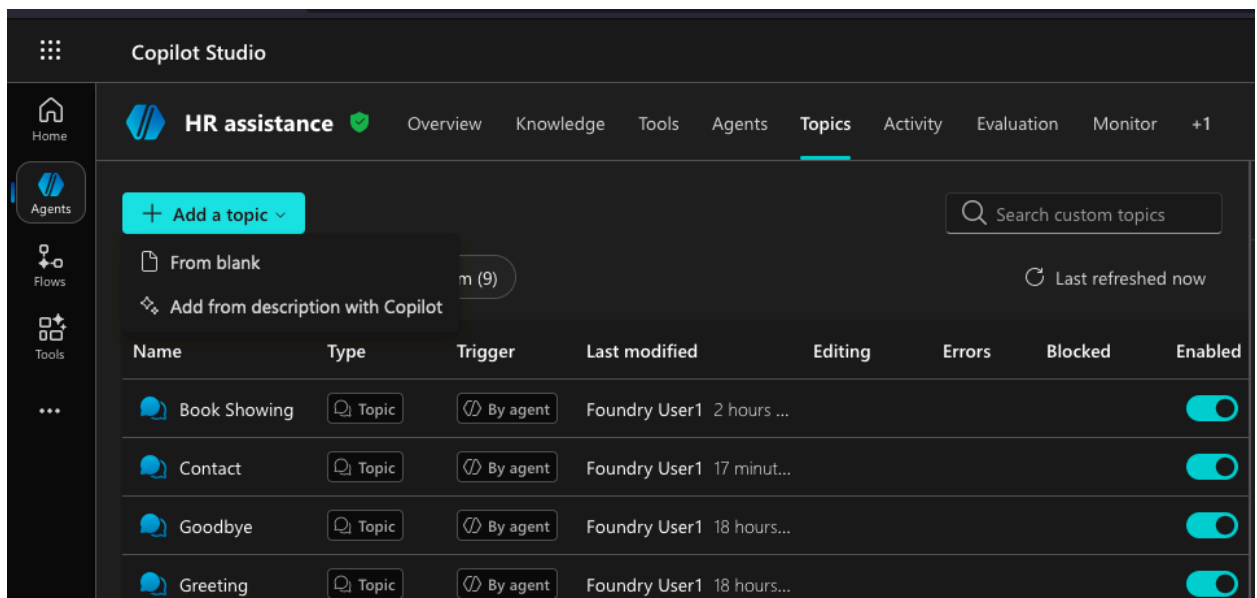

Copilot: "How can I help you today?"

1. Apply for Leave
2. Check Leave Balance
3. Leave Policy Information

Depending on the option selected, the copilot should provide a different response.

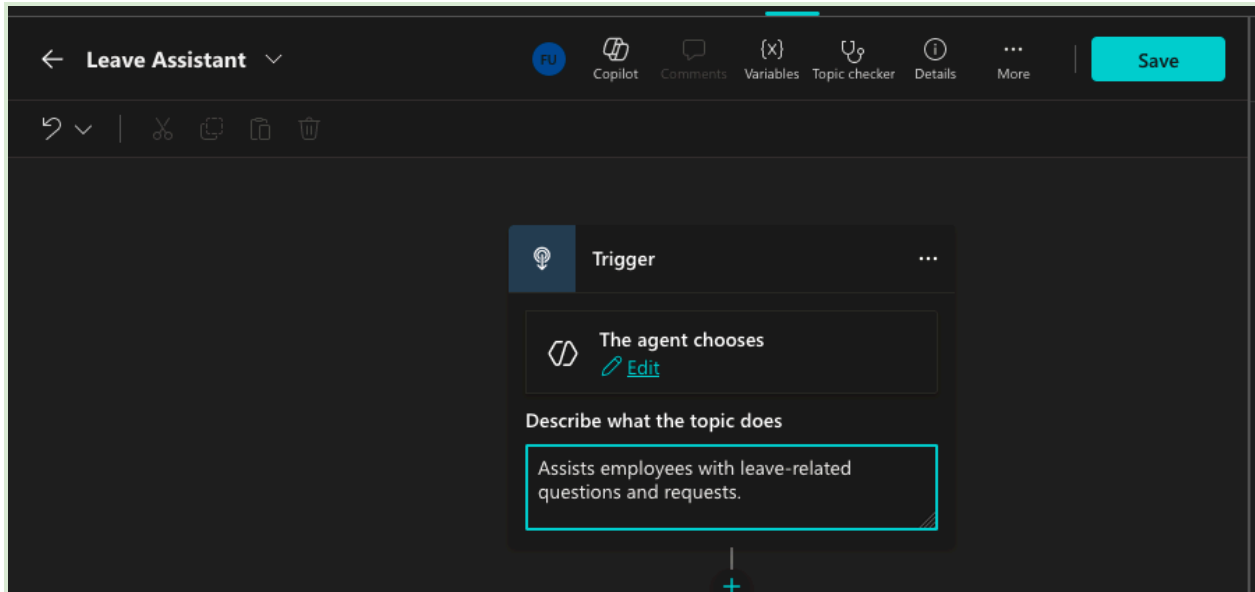

Task 1: Create a New Topic

1. Open Microsoft Copilot Studio.
2. Navigate to Topics.
3. Select **From blank**.

4. Create a topic named: **Leave Assistant**
Description: **Assists employees with leave-related questions and requests.**

Save the topic.

Expected Outcome

A new Leave Assistant topic is created.

Task 2: Ask the User a Question

1. Add an **Ask a Question node**.
2. Configure the question: **How can I help you today?**
3. Add the following options:
 - Apply for Leave
 - Check Leave Balance
 - Leave Policy Information
4. Store the response in a variable called: **UserChoice**

Expected Outcome

The user's selection should be stored in the UserChoice variable.

Task 3: Add Conditional Logic

Below the question node:

1. Select Add Node.
2. Select Condition.

Configure the first condition:

If UserChoice = Apply for Leave

Add a message node:

You can submit a leave request through the Employee Self-Service Portal.

Add a second condition:

If UserChoice = Check Leave Balance

Add a message node:

Your leave balance can be viewed in the HR Management System.

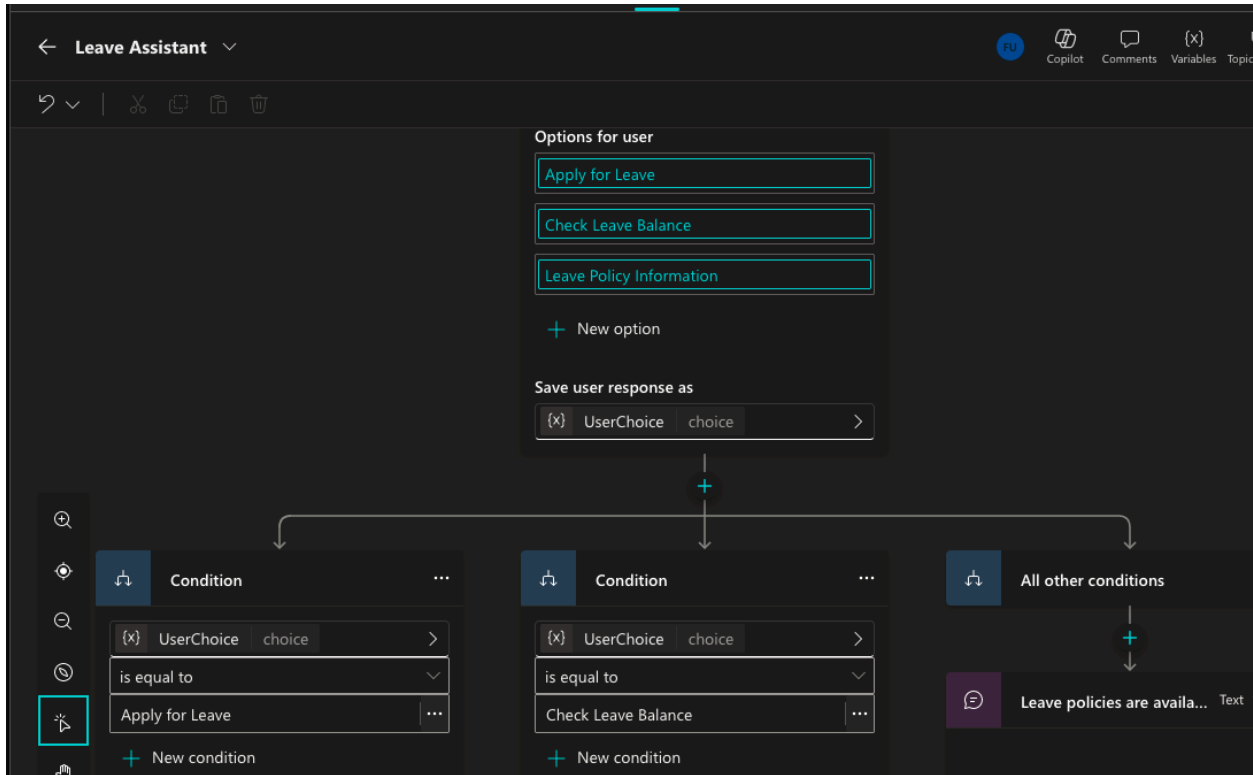

Configure the Default branch (All Other Conditions):

Add a message node:

Leave policies are available on the HR Portal under Policies and Guidelines.

Expected Outcome

Three separate conversation paths should be available based on the employee's selection.

Task 4: Test the Conversation

Open Test Your Copilot.

Scenario 1

Input: I need leave information.

Select: Apply for Leave

Verify that the correct branch executes.

Task 5: Enhance the User Experience

Update each response with additional guidance.

Apply for Leave

You can submit a leave request through the Employee Self-Service Portal. Ensure your manager approves the request before your planned leave dates.

Check Leave Balance

Your available leave balance can be found in the HR Management System under My Profile.

Leave Policy Information

You can access leave policies in the HR Portal. Policies include annual leave, sick leave, parental leave, and special leave provisions.

Expected Outcome

The responses become more informative and useful for employees.

Task 6: Test the Conversation Again

Open Test Your Copilot.

Scenario 1

Input: I need leave information.

Select: Apply for Leave

Verify that the correct branch executes.

Scenario 2

Input: I have a question about my holidays.

Select: Check Leave Balance

Verify that the balance message appears.

Scenario 3

Input: Show me leave rules.

Select: Leave Policy Information

Verify that the policy information branch executes.

Test Results

User Selection		Expected Result
Apply for Leave		Leave request guidance displayed
Check Leave Balance		Leave balance guidance displayed
Leave Policy Information		Policy information displayed
