

Lab 17 – Configure Dataverse Knowledge

Lab Duration: 20 Minutes

Lab Overview

In this lab, you will configure a **Microsoft Dataverse table** as a knowledge source for your Copilot. Unlike Website, PDF, or SharePoint knowledge, Dataverse allows you to improve AI understanding by configuring **column synonyms** and **glossary terms**.

Business Scenario

Contoso stores employee information in a Dataverse table. However, users ask questions using business terms like **Manager**, **Employee ID**, and **Department**, while the Dataverse table contains technical column names. Your task is to configure the Dataverse knowledge source so the Copilot understands these business terms.

Note

Dataverse knowledge requires **Dataverse Search** to be enabled and the agent authentication must be set to **Authenticate with Microsoft**. Users also need permission to access the Dataverse tables.

Lab Instructions :

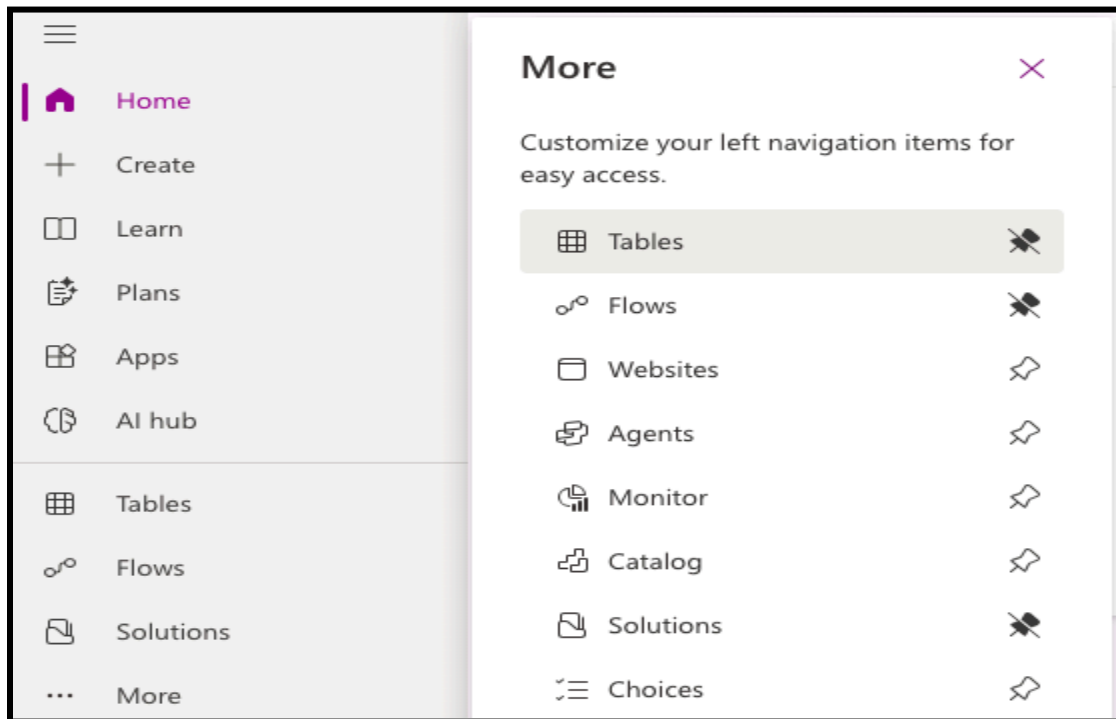

Task 0 – Create an Employee Table (If Not Available)

If an Employee table is not available in your Dataverse environment, create one by following these steps.

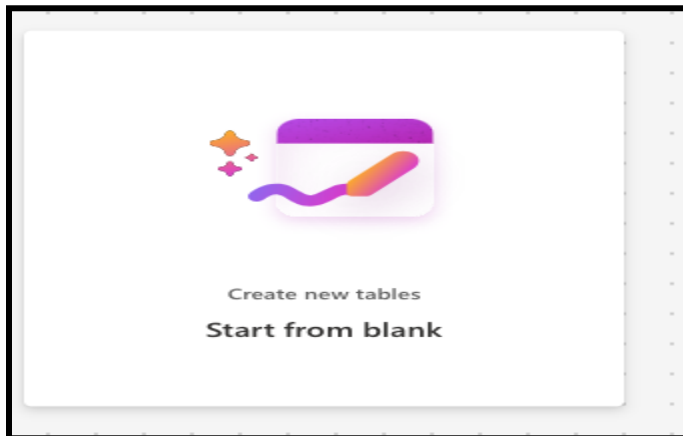

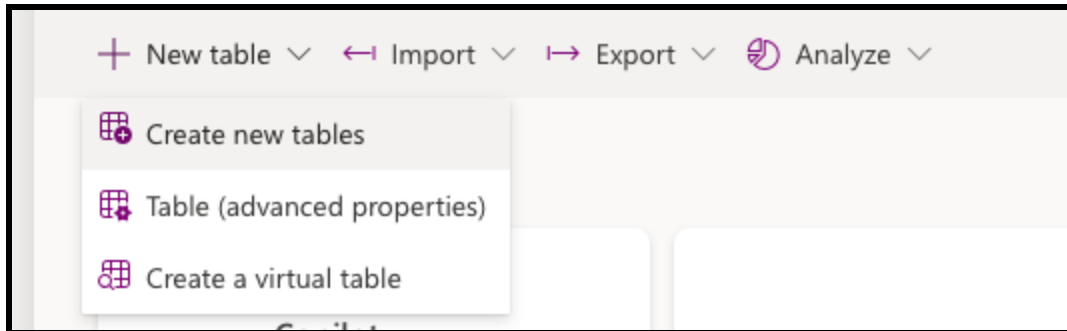

Step 1 : Open Power Apps (<https://make.powerapps.com/>)

Step 2: Select your Power Platform Environment same as the copilot studio environment you are working in.

Step 3: From the left navigation, select **more** : Tables

Step 4 - Click: + New table

Step 5: Enter the following details:

Property	Value
Display Name	Employee
Plural Name	Employees

Employee
...

New column

Show less

View data

Row ownership

Properties

Remove

Create the following columns in the table.

Column Name	Data Type
-------------	-----------

Employee ID	Text
Department	Text
Joining Date	Date Only

Click **Save Table** and then **Publish**.

Task 0.2 – Add Sample Records

Add the following sample records.

Employee Name	Employee ID	Department	Joining Date
Rahul Sharma	EMP001	Sales	July 15, 2023
Neha Gupta	EMP002	HR	May 12, 2020

Save and exit.

Go to Copilot Studio...

Task 1 – Add a Dataverse Table

Step 1 - Open your Copilot in **Microsoft Copilot Studio**.

Step 2 - Select **Knowledge** from the left navigation.

Step 3 - Click **+ Add knowledge**.

Step 4 - Select **Dataverse**. And search for employee table

Dataverse knowledge source

Task 2 – Select the Table

Search for the following table.

Employee

Select the table.

Click **Next**.

Note

You can add up to **15 Dataverse tables** in a single Dataverse knowledge source. Table recommendations are based on your agent's name.

Task 3 – Configure the Knowledge Source

Enter the following values.

Field	Value
Name	Employee Information

Description	Employee records containing employee ID, department, designation, manager, office location, email address, and business contact details.
-------------	--

Click **Next**.

A detailed description helps the AI determine when this knowledge source should be used during response generation.

Task 4 – Configure Column Synonyms

Click **Edit Synonyms**.

Add the following examples.

Dataverse Column	Synonym
empid	Employee ID
mgr	Manager
dept	Department
doj	Joining Date
loc	Office Location

Click **Back** to save the changes.

Why are synonyms important?

If your Dataverse table contains technical or abbreviated column names, synonyms help the AI understand what those fields represent. This is especially useful for custom or numeric fields.

Task 5 – Add Glossary Terms

Click **Edit Glossary**.

Add the following glossary entries.

Glossary Term	Description
HR	Human Resources Department
PTO	Paid Time Off

Manager Employee's Reporting
Manager

DOJ Date of Joining

Click **Back**.

Note

Glossary definitions help the AI understand business terminology, acronyms, and organization-specific language. Updates to glossary terms may take up to **15 minutes** to become available.

Task 6 – Save the Knowledge Source

Click **Add to agent**

Wait until the knowledge source is successfully added.

Task 7 – Test the Agent

Open the **Test your agent** pane.

Ask the following questions:

Question 1

What is the joining date of Rahul?

Question 2

Which department does Neha Gupta work in?

Observe how the agent recognizes terms such as **Manager**, **Department**, and **PTO** because of the configured synonyms and glossary.

Expected Result

Your Copilot should:

- Retrieve information from the Dataverse table.
- Recognize business terms and abbreviations.
- Generate more accurate responses using synonyms and glossary definitions.
